Summary
From one end of the country to the other, America is connected by the best freight rail system in the world. The seven large “Class I” railroads, working with hundreds of smaller railroads and tens of thousands of rail customers, deliver economic growth, support job creation, and provide crucial environmental benefits such as reduced highway gridlock and cleaner air. America’s freight railroads are almost entirely privately owned and operated: unlike trucks and barges, freight railroads operate overwhelmingly on infrastructure that they own, build, maintain, and pay for themselves. In recent years, railroads have been spending more than ever before on enhancing their nearly 140,000-mile network. Railroads are getting ready today to meet the freight transportation challenges of tomorrow.

Delivering the Goods Across the Country and to the World
More than 600 freight railroads operate in the United States. The seven “Class I” railroads — railroads with 2018 revenue of at least $490 million — account for around 68 percent of freight rail mileage, 88 percent of employees, and 94 percent of revenue. Each Class I railroad operates in multiple states over thousands of miles of track.

Non-Class I railroads (also known as short line and regional railroads) range in size from tiny operations handling a few carloads a month to multi-state operations close to Class I size. Collectively, they earn several billion dollars in revenue each year.

Together, U.S. freight railroads form an integrated, nearly 140,000-mile system that earned close to $80 billion in revenue in 2019 and that provides the world’s safest, most productive, and most cost-effective freight rail service.

From the food on our tables to the cars we drive to the shoes on our children’s feet, freight railroads carry the things America depends on:

- Railroads carry enormous amounts of corn, wheat, soybeans, and other grains; fertilizers, plastic resins, and a vast array of other chemicals; cement, sand, and crushed stone to build our highways; lumber and drywall to build our homes; autos and auto parts; animal feed, canned goods, corn syrup, flour, frozen chickens, beer, and countless other food products; steel and other metal products; crude oil, liquefied gases, and other petroleum products; paper products; iron ore and scrap metal for steelmaking; and much more, including large amounts of coal to power plants.
- **Rail intermodal** is the movement of shipping containers and truck trailers by rail. It’s been the fastest growing major rail traffic segment over the past 25 years and set a new annual volume record in 2018. Just about everything you find on a retailer’s shelves may have traveled on an intermodal train. Around half of rail intermodal consists of imports or exports, reflecting the vital role intermodal plays in international trade.

### Carrying the Things America Depends On

<table>
<thead>
<tr>
<th>Intermodal: 13.7 million trailers and containers</th>
<th>Food products: 1.6 million carloads</th>

### The Right Track for the Economy

America’s freight railroads **connect producers and consumers across the country and the world,** expanding existing markets and opening new ones.

The approximately 150,000 freight railroad employees are among America’s most highly compensated workers. In 2018, the average U.S. Class I freight rail employee earned wages of $92,300 and fringe benefits of $37,900, for total compensation of $130,200. By contrast, the average wage per full-time equivalent U.S. employee in 2018 was $64,100 (just 69% percent of the rail figure) and average total compensation was $78,800 (61 percent of the rail figure).

An October 2018 study from Towson University’s Regional Economic Studies Institute found that, in 2017 alone, **the operations and capital investment of America’s major freight railroads supported approximately 1.1 million jobs** (nearly eight jobs for every railroad job), **$219 billion in economic output**, and **$71 billion in wages**. Railroads also generated nearly **$26 billion in tax revenues**. In addition, millions of Americans work in industries that are more competitive in the tough global economy thanks to the affordability and productivity of America’s freight railroads.

**Without railroads, American firms and consumers would be unable to participate in the global economy anywhere near as fully as they do today.** International trade accounts
for around 35 percent of U.S. rail revenue, 27 percent of U.S. rail tonnage, and 42 percent of the carloads and intermodal units U.S. railroads carry.

**Affordable and Efficient**

The affordability of freight rail saves rail customers (and, ultimately, American consumers) billions of dollars each year and enhances the global competitiveness of U.S. products. **Average rail rates** (measured by inflation-adjusted revenue per ton-mile) were **44 percent lower in 2018 than in 1981.** This means the average rail shipper can move close to twice as much freight for around the same price it paid more than 35 years ago.

Several years ago, the American Association of State Highway and Transportation Officials (AASHTO) estimated that if all freight rail traffic were shifted to trucks, rail customers would have to pay an additional $69 billion per year. Adjusted for increased freight volume and inflation, it’s probably close to $100 billion today.

**Investing for the Future**

As America’s economy grows, the need to move more freight will grow too. The Federal Highway Administration forecasts that total U.S. freight shipments will rise from an estimated 18.6 billion tons in 2018 to 24.1 billion tons in 2040 — a 30% increase. Railroads are getting ready today to meet this challenge:

- America’s freight railroads operate overwhelmingly on infrastructure that they **own, build, maintain, and pay for themselves.** By contrast, trucks, airlines, and barges operate on highways, airways, and waterways that are publicly funded.

- From 1980 to 2019, America’s freight railroads spent more than $710 billion — their own funds, not taxpayer funds — on capital expenditures and maintenance expenses related to locomotives, freight cars, tracks, bridges, tunnels and other infrastructure and equipment. That’s more than 40 cents out of each revenue dollar. **America’s freight railroads have been spending more in recent years than ever before** on a network that keeps our economy moving.
Over the past decade, the average U.S. manufacturer has spent about 3 percent of revenue on capital expenditures. The comparable figure for U.S. freight railroads is close to 19 percent, or about six times higher.

Always Looking to Improve Safety

Nothing is more important to railroads than safety, and railroads know the safety challenge never ends. That’s why railroads, in cooperation with policymakers, their employees, suppliers, and customers, are constantly looking for new technologies, operational enhancements, improved training, and other ways to further improve their already excellent safety record.

The train accident rate in 2019 was down 33 percent from 2000; the employee injury rate in 2019 was down 46 percent from 2000; and the grade crossing collision rate in 2019 was down 32 percent from 2000. By all these measures, the most recent decade has been the safest in history.
• Railroads today have lower employee injury rates than most other major industries, including trucking, airlines, agriculture, mining, manufacturing, and construction — even lower than food stores.

Virtually every aspect of rail operations is subject to safety oversight by the Federal Railroad Administration (FRA). For example, stringent FRA regulations cover track and equipment inspections, employee certification, operating speeds, and signals. FRA safety inspectors (and in some states, state inspectors) evaluate rail facilities and operations. Railroads are also subject to oversight by the Occupational Safety and Health Administration, the Pipeline and Hazardous Materials Safety Administration, and the Department of Homeland Security.

Railroads are constantly incorporating new technologies to improve safety. Just a few examples: sophisticated detectors along tracks that identify defects on passing rail cars; ground-penetrating radar that identifies problems below ground, such as excessive moisture, that could destabilize track; and specialized rail cars that use sophisticated instruments to identify defects in tracks.

Essential to a Greener, Less-Congested Future

Railroads are the most environmentally sound way to move freight over land. In 2018, U.S. railroads moved a ton of freight an average of 473 miles per gallon of fuel. On average, railroads are three to four times more fuel efficient than trucks. Because greenhouse gas emissions are directly related to fuel consumption, moving freight by rail instead of truck reduces greenhouse gas emissions by up to 75 percent, on average. Because a single train can replace several hundred trucks, railroads help reduce highway gridlock and the need to spend scarce taxpayer dollars on highways.

A Need for Reasonable Regulation

Largely because of decades of excessive regulation, by the 1970s U.S. freight railroads were on the brink of ruin. Railroad bankruptcies were common, and tracks and equipment were falling apart because railroads couldn’t afford the cost of maintenance. The economy suffered greatly because railroads could not provide the quality service their customers needed.

Recognizing the need for reform, in 1980 Congress passed the Staggers Rail Act. The Staggers Act put in place a more reasonable regulatory system under which railroads could largely decide for themselves — rather than have Washington decide for them — what routes to use, what services to offer, and what prices to charge. Railroads today don’t have unlimited freedom to charge whatever they want, though. If a railroad faces no effective competition for its services, the Surface Transportation Board can limit what the railroad can charge.

Unfortunately, some shortsighted groups are calling for a return to the days of unbalanced and unreasonable rail regulation. Policymakers should reject these calls. America needs a common-sense regulatory system that provides effective oversight but gives railroads the opportunity to earn enough to provide the rail system our economy needs to grow. Rail investment should be encouraged, and regulations and legislation should not harm railroads’ ability or willingness to make those investments.
